1 Introduction

This Configuration Note describes how to set up the AudioCodes Enterprise Session Border Controller (hereafter, referred to as *SBC*) for interworking between Swisscom's SIP Trunk and Microsoft's Teams Direct Routing environment.

You can also use AudioCodes' SBC Wizard tool to automatically configure the SBC based on this interoperability setup. However, it is recommended to read through this document to better understand the various configuration options. For more information on AudioCodes' SBC Wizard including the download option, visit AudioCodes Web site at <https://www.audiocodes.com/partners/sbc-interoperability-list>.

1.1 Intended Audience

This document is intended for engineers, or AudioCodes and Swisscom partners who are responsible for installing and configuring Swisscom's SIP Trunk and Microsoft's Teams Direct Routing Service for enabling VoIP calls using AudioCodes SBC.

1.2 About AudioCodes SBC Product Series

AudioCodes' family of SBC devices enables reliable connectivity and security between the Enterprise's and the service provider's VoIP networks.

The SBC provides perimeter defense as a way of protecting Enterprises from malicious VoIP attacks; mediation for allowing the connection of any PBX and/or IP-PBX to any service provider; and Service Assurance for service quality and manageability.

Designed as a cost-effective appliance, the SBC is based on field-proven VoIP and network services with a native host processor, allowing the creation of purpose-built multiservice appliances, providing smooth connectivity to cloud services, with integrated quality of service, SLA monitoring, security and manageability. The native implementation of SBC provides a host of additional capabilities that are not possible with standalone SBC appliances such as VoIP mediation, PSTN access survivability, and third-party value-added services applications. This enables Enterprises to utilize the advantages of converged networks and eliminate the need for standalone appliances.

AudioCodes SBC is available as an integrated solution running on top of its field-proven Mediant Media Gateway and Multi-Service Business Router platforms, or as a software-only solution for deployment with third-party hardware. The SBC can be offered as a Virtualized SBC, supporting the following platforms: Hyper-V, AWS, AZURE, AWP, KVM and VMWare.

1.3 About Microsoft Teams Direct Routing

Microsoft Teams Direct Routing allows connecting a customer-provided SBC to the Microsoft Phone System. The customer-provided SBC can be connected to almost any telephony trunk, or connect with third-party PSTN equipment. The connection allows:

- Using virtually any PSTN trunk with Microsoft Phone System
- Configuring interoperability between customer-owned telephony equipment, such as third-party PBXs, analog devices, and Microsoft Phone System

This page is intentionally left blank.

2 Component Information

2.1 AudioCodes SBC Version

Table 2-1: AudioCodes SBC Version

SBC Vendor	AudioCodes
Models	<ul style="list-style-type: none"> ▪ Mediant 500 Gateway & E-SBC ▪ Mediant 500L Gateway & E-SBC ▪ Mediant 800B Gateway & E-SBC ▪ Mediant 1000B Gateway & E-SBC ▪ Mediant 2600 E-SBC ▪ Mediant 4000 SBC ▪ Mediant 4000B SBC ▪ Mediant 9000 SBC ▪ Mediant Software SBC (SE and VE)
Software Version	7.20A.202.203
Protocol	<ul style="list-style-type: none"> ▪ SIP/TCP (to the Swisscom SIP Trunk) ▪ SIP/TLS (to the Teams Direct Routing)
Additional Notes	None

2.4 Interoperability Test Topology

Microsoft Teams Direct Routing can be implemented in the *Enterprise* or *Hosting* Models.

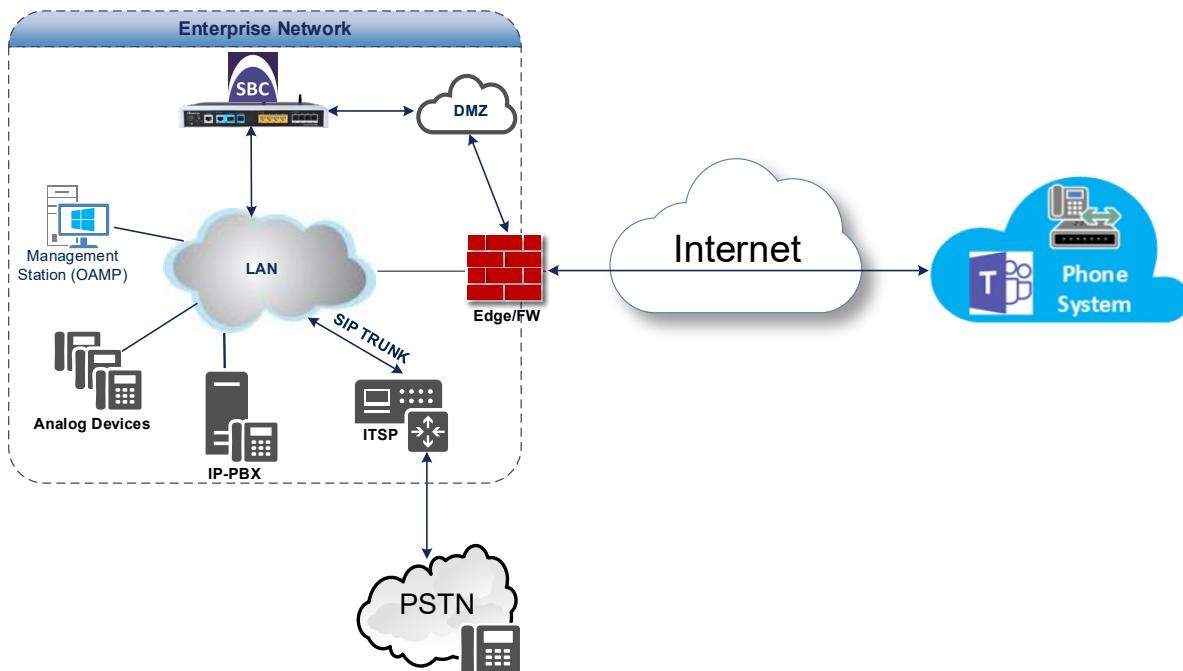

2.4.1 Enterprise Model Implementation

The interoperability testing between AudioCodes SBC and Swisscom SIP Trunk with Teams Direct Routing Enterprise Model was done using the following topology setup:

- Enterprise deployed with third-party IP-PBX, analog devices and the administrator's management station, located on the LAN
- Enterprise deployed with Microsoft Teams Phone System Direct Routing Interface located on the WAN for enhanced communication within the Enterprise
- Enterprise wishes to offer its employees enterprise-voice capabilities and to connect the Enterprise to the PSTN network using Swisscom's SIP Trunking service
- AudioCodes SBC is implemented to interconnect between the SIP Trunk in the Enterprise LAN and Microsoft Teams on the WAN
 - **Session:** Real-time voice session using the IP-based Session Initiation Protocol (SIP).
 - **Border:** IP-to-IP network border - The Swisscom's SIP Trunk is located in the Enterprise LAN (or WAN) and the Microsoft Teams Phone Systems is located in the public network.

The figure below illustrates this interoperability test topology:

Figure 2-1: Interoperability Test Topology between SBC and Microsoft Teams Direct Routing Enterprise Model with Swisscom SIP Trunk

2.4.2 Environment Setup

The interoperability test topology includes the following environment setup:

Table 2-4: Environment Setup

Area	Setup
Network	<ul style="list-style-type: none"> ▪ Microsoft Teams Direct Routing environment is located on the Enterprise's (or Service Provider's) WAN ▪ Swisscom SIP Trunk is located on the LAN
Signaling Transcoding	<ul style="list-style-type: none"> ▪ Microsoft Teams Direct Routing operates with SIP-over-TLS transport type ▪ Swisscom SIP Trunk operates with SIP-over-TCP transport type
Codecs Transcoding	<ul style="list-style-type: none"> ▪ Microsoft Teams Direct Routing supports G.711A-law, G.711U-law, G.729, G.722, SILK (NB and WB) and OPUS coders ▪ Swisscom SIP Trunk supports G.711A-law, G.711U-law, and G.729 coders
Media Transcoding	<ul style="list-style-type: none"> ▪ Microsoft Teams Direct Routing operates with SRTP media type ▪ Swisscom SIP Trunk operates with RTP media type

2.4.3 Infrastructure Prerequisites

The table below shows the list of infrastructure prerequisites for deploying Microsoft Teams Direct Routing.

Table 2-5: Infrastructure Prerequisites

Infrastructure Prerequisite	Details
Certified Session Border Controller (SBC)	
SIP Trunks connected to the SBC	
Office 365 Tenant	
Domains	
Public IP address for the SBC	
Fully Qualified Domain Name (FQDN) for the SBC	
Public DNS entry for the SBC	
Public trusted certificate for the SBC	
Firewall ports for Direct Routing Signaling	
Firewall IP addresses and ports for Direct Routing Media	
Media Transport Profile	
Firewall ports for Teams Clients Media	

2.4.4 Known Limitations

The following limitations were observed during the interoperability tests done for the AudioCodes SBC interworking between Microsoft Teams Direct Routing and Swisscom 's SIP Trunk:

- As the Microsoft Teams client does not show the dialpad before the call is established (early-media scenario), it is not possible to send DTMF to interact with some IVR's.
- Calls with special arrangements will be billed on the trunk main number instead of the user number. This is because the SIP P-Asserted Identity header contains the same number as the SIP 'From' header. This limitation does not affect the completion of such calls.

3 Configuring Teams Direct Routing

This section describes how to configure Microsoft Teams Direct Routing to operate with AudioCodes SBC.

3.1 Prerequisites

Before you begin configuration, make sure you have the following for every Hosting SBC you want to pair:

- Public IP address
- FQDN name matching SIP addresses of the users
- Public certificate, issued by one of the supported CAs

3.2 SBC Domain Name in the Teams Enterprise Model

The SBC domain name must be from one of the names registered in 'Domains' of the tenant. You cannot use the ***.onmicrosoft.com** tenant for the domain name. For example, in Figure 2-2, the administrator registered the following DNS names for the tenant:

Table 3-1: DNS Names Registered by an Administrator for a Tenant

DNS name	Can be used for SBC FQDN	Examples of FQDN names
ACeducation.info	Yes	<p>Valid names:</p> <ul style="list-style-type: none"> ▪ sbc.ACeducation.info ▪ ussbcs15.ACeducation.info ▪ europe.ACeducation.info <p>Invalid name: sbc1.europe.ACeducation.info (requires registering domain name europe.atatum.biz in 'Domains' first)</p>
adatumbiz.onmicrosoft.com	No	Using *.onmicrosoft.com domains is not supported for SBC names
hybridvoice.org	Yes	<p>Valid names:</p> <ul style="list-style-type: none"> ▪ sbc1.hybridvoice.org ▪ ussbcs15.hybridvoice.org ▪ europe.hybridvoice.org <p>Invalid name: sbc1.europe.hybridvoice.org (requires registering domain name europe.hybridvoice.org in 'Domains' first)</p>

Users can be from any SIP domain registered for the tenant. For example, you can provide users user@ACeducation.info with the SBC FQDN **sbc1.hybridvoice.org** so long as both names are registered for this tenant.

Figure 3-1: Example of Registered DNS Names

The screenshot shows the Microsoft 365 Admin center interface. On the left, there is a navigation sidebar with various categories like Home, Users, Groups, Resources, Billing, Support, Settings, Setup, Products, Domains (which is selected), Data migration, Reports, Health, and Admin centers. The main content area is titled "Home > Domains". It features a search bar with "Domain name" placeholder and three buttons: "+ Add domain", "+ Buy domain", and "View". A dropdown menu shows "All domains" and a "▼" icon. Below the search bar, a list of registered domains is displayed, with "adatum.biz (Default)" highlighted. The list includes "adatumbiz.onmicrosoft.com" and "hybridvoice.org".

Use the following command on the Microsoft Teams Direct Routing Management Shell after reconfiguration, to verify correct values:

■ Get-CsOnlinePSTNGateway

```
Identity : sbc.ACeducation.info
Fqdn : sbc.ACeducation.info
SipSignallingPort : 5068
CodecPriority : SILKWB, SILKNB, PCMU, PCMA
ExcludedCodecs :
FailoverTimeSeconds : 10
ForwardCallHistory : True
ForwardPai : False
SendSipOptions : True
MaxConcurrentSessions :
Enabled : True
MediaBypass : False
```

4 Configuring AudioCodes SBC

This section provides step-by-step procedures on how to configure AudioCodes SBC for interworking between Microsoft Teams Direct Routing and the Swisscom SIP Trunk. These configuration procedures are based on the interoperability test topology described in Section 2.4 on page 10, and includes the following main areas:

- SBC LAN interface - Swisscom SIP Trunking environment
- SBC WAN interface - Teams Direct Routing environment

This configuration is done using the SBC's embedded Web server (hereafter, referred to as *Web interface*).

Notes:

- For implementing Microsoft Teams Direct Routing and Swisscom SIP Trunk based on the configuration described in this section, AudioCodes SBC must be installed with a License Key that includes the following software features:
 - ✓ Microsoft
 - ✓ Security
 - ✓ DSP
 - ✓ RTP
 - ✓ SIP
 - ✓ Number of SBC sessions [Based on requirements]
 - ✓ Transcoding sessions [If media transcoding is needed]
 - ✓ SILK and OPUS coders [Based on requirements]

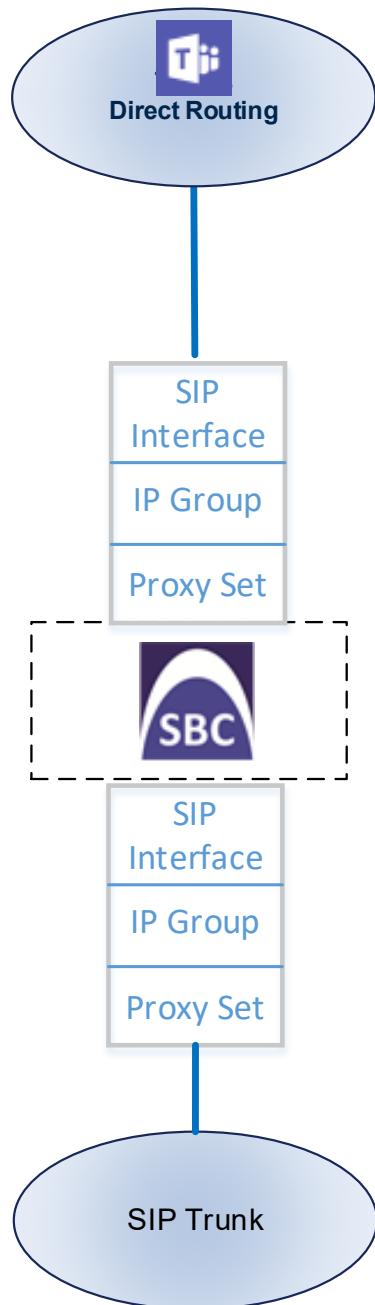

For more information about the License Key, contact your AudioCodes sales representative.

- The scope of this interoperability test and document does **not** cover all security aspects for configuring this topology. Comprehensive security measures should be implemented per your organization's security policies. For security recommendations on AudioCodes' products, refer to the *Recommended Security Guidelines* document, which can be found at AudioCodes web site

4.1 SBC Configuration Concept in Teams Direct Routing Enterprise Model

The diagram below represents AudioCodes' device configuration concept in the Enterprise Model.

Figure 4-1: SBC Configuration Concept

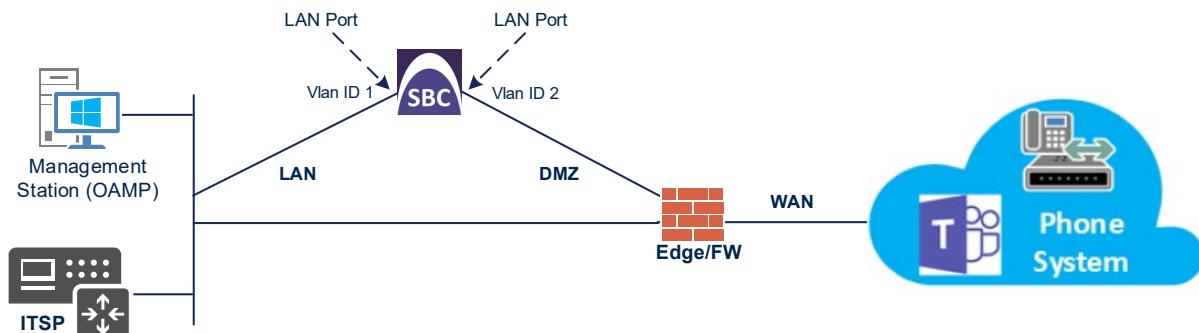

4.2 IP Network Interfaces Configuration

This step describes how to configure the SBC's IP network interfaces. There are several ways to deploy the SBC; however, this interoperability test topology employs the following deployment method:

- SBC interfaces with the following IP entities:
 - Teams Direct Routing, located on the WAN
 - Swisscom SIP Trunk, located on the LAN (or private VPN/MPLS connection to the Service Provider Network)
- SBC connects to the WAN through a DMZ network.
- Physical connection: The type of physical connection depends on the method used to connect to the Enterprise's network. In the interoperability test topology, SBC connects to the LAN and DMZ using dedicated Ethernet ports (i.e., two ports and two network cables are used).
- SBC also uses two logical network interfaces:
 - LAN (VLAN ID 1)
 - DMZ (VLAN ID 2)

Figure 4-2: Network Interfaces in Interoperability Test Topology

4.2.1 Configure VLANs

This step describes how to configure VLANs for each of the following interfaces:

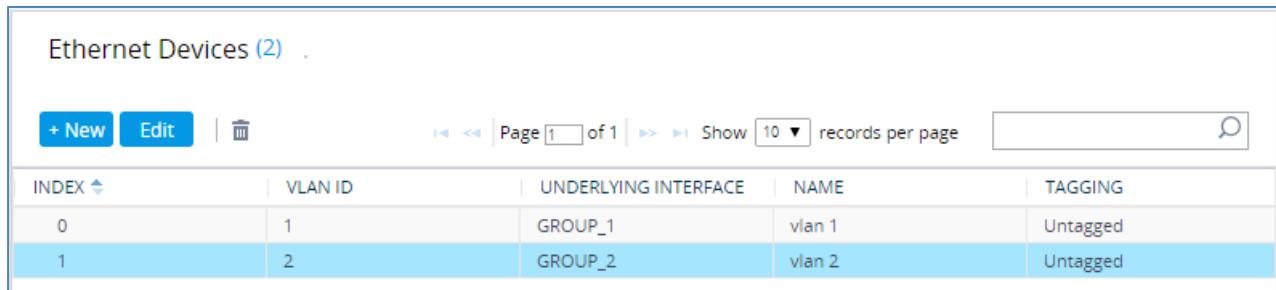

- LAN VoIP (assigned the name "LAN_IF")
- WAN VoIP (assigned the name "WAN_IF")

➤ **To configure the VLANs:**

1. Open the Ethernet Device table (**Setup** menu > **IP Network** tab > **Core Entities** folder > **Ethernet Devices**).
2. There will be one existing row for VLAN ID 1 and underlying interface GROUP_1.
3. Add another VLAN ID 2 for the WAN side as follows:

Parameter	Value
Index	1
VLAN ID	2
Underlying Interface	GROUP_2 (Ethernet port group)
Name	vlan 2
Tagging	Untagged

Figure 4-3: Configured VLAN IDs in Ethernet Device

The screenshot shows a table titled 'Ethernet Devices (2)'. The table has columns for INDEX, VLAN ID, UNDERLYING INTERFACE, NAME, and TAGGING. Row 0 has INDEX 0, VLAN ID 1, UNDERLYING INTERFACE GROUP_1, NAME vlan 1, and TAGGING Untagged. Row 1 has INDEX 1, VLAN ID 2, UNDERLYING INTERFACE GROUP_2, NAME vlan 2, and TAGGING Untagged. The table includes navigation buttons for New, Edit, Delete, Page, Show, and a search bar.

Ethernet Devices (2)				
+ New	Edit	Delete	Page 1 of 1	Show 10 records per page
INDEX	VLAN ID	UNDERLYING INTERFACE	NAME	TAGGING
0	1	GROUP_1	vlan 1	Untagged
1	2	GROUP_2	vlan 2	Untagged

4.2.2 Configure Network Interfaces

This step describes how to configure the IP network interfaces for each of the following interfaces:

- LAN VoIP (assigned the name "LAN_IF")
- WAN VoIP (assigned the name "WAN_IF")

➤ **To configure the IP network interfaces:**

1. Open the IP Interfaces table (**Setup** menu > **IP Network** tab > **Core Entities** folder > **IP Interfaces**).
2. Modify the existing LAN network interface:
 - a. Select the 'Index' radio button of the **OAMP + Media + Control** table row, and then click **Edit**.
 - b. Configure the interface as follows:

Parameter	Value
Name	LAN_IF (arbitrary descriptive name)
Ethernet Device	vlan 1
IP Address	10.15.17.77 (LAN IP address of SBC)
Prefix Length	16 (subnet mask in bits for 255.255.0.0)
Default Gateway	10.15.0.1
Primary DNS	10.15.27.1

3. Add a network interface for the WAN side:

- a. Click **New**.
- b. Configure the interface as follows:

Parameter	Value
Name	WAN_IF
Application Type	Media + Control
Ethernet Device	vlan 2
IP Address	195.189.192.157 (DMZ IP address of SBC)
Prefix Length	25 (subnet mask in bits for 255.255.255.128)
Default Gateway	195.189.192.129 (router's IP address)
Primary DNS	80.179.52.100
Secondary DNS	80.179.55.100

4. Click **Apply**.

The configured IP network interfaces are shown below:

Figure 4-4: Configured Network Interfaces in IP Interfaces Table

IP Interfaces (2) .										
				Page 1 of 1		Show 10 records per page				
INDEX	NAME	APPLICATION TYPE	INTERFACE MODE	IP ADDRESS	PREFIX LENGTH	DEFAULT GATEWAY	PRIMARY DNS	SECONDARY DNS	ETHERNET DEVICE	
0	LAN_IF	OAMP + Media +	IPv4 Manual	10.15.17.77	16	10.15.0.1	10.15.27.1	0.0.0.0	vlan 1	
1	WAN_IF	Media + Control	IPv4 Manual	195.189.192.157	25	195.189.192.129	80.179.52.100	80.179.55.100	vlan 2	

4.3 SIP TLS Connection Configuration

This section describes how to configure the SBC for using a TLS connection with the Teams Direct Routing Phone System. This is essential for a secure SIP TLS connection. The configuration instructions in this section are based on the following domain structure example that must be implemented as part of the certificate which must be loaded to the host SBC:

- CN: ACeducation.info
- SAN: *.customers.ACeducation.info

This certificate module is based on the Service Provider's own TLS Certificate. For more certificate structure options, see Microsoft Teams Direct Routing documentation.

The Microsoft Phone System Direct Routing Interface allows **only** TLS connections from SBCs for SIP traffic with a certificate signed by one of the Trusted Certification Authorities. Currently, supported Certification Authorities can be found in the following link:

<https://docs.microsoft.com/en-us/microsoftteams/direct-routing-plan#public-trusted-certificate-for-the-sbc>

4.3.1 Configure the NTP Server Address

This step describes how to configure the NTP server's IP address. It is recommended to implement an NTP server (Microsoft NTP server or another global server) to ensure that the SBC receives the current date and time. This is necessary for validating certificates of remote parties.

➤ **To configure the NTP server address:**

1. Open the Time & Date page (**Setup** menu > **Administration** tab > **Time & Date**).
2. In the 'Primary NTP Server Address' field, enter the IP address of the NTP server (e.g., **pool.ntp.org**).

Figure 4-5: Configuring NTP Server Address

NTP SERVER	
Enable NTP	Enable
Primary NTP Server Address (IP or FQDN)	pool.ntp.org
Secondary NTP Server Address (IP or FQDN)	
NTP Update Interval	Hours: 24 Minutes: 0
NTP Authentication Key Identifier	0
NTP Authentication Secret Key	

3. Click **Apply**.

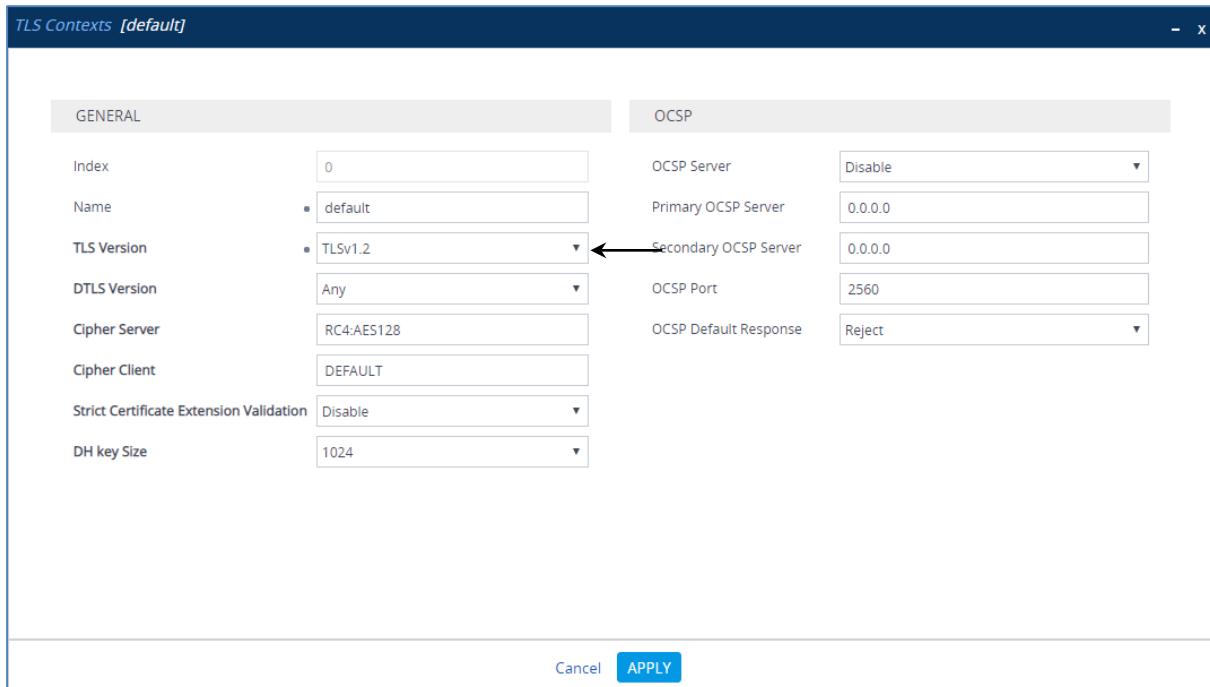

4.3.2 Configure the TLS version

This step describes how to configure the SBC to use TLS Version 1.2 only. Microsoft requires implementing only TLS Version 1.2.

➤ **To configure the TLS version:**

1. Open the TLS Contexts table (**Setup** menu > **IP Network** tab > **Security** folder > **TLS Contexts**).
2. In the TLS Contexts table, select the required TLS Context index row (usually default Index 0 will be used), and then click '**Edit**'.
3. From the '**TLS Version**' drop-down list, select '**TLSv1.2**'

Figure 4-6: Configuring TLS version

4. Click **Apply**.

4.3.3 Configure a Certificate

This step describes how to request a certificate for the SBC and to configure it based on the example of DigiCert Global Root CA. The certificate is used by the SBC to authenticate the connection with Teams Direct Routing.

The procedure involves the following main steps:

- a. Generating a Certificate Signing Request (CSR).
- b. Requesting Device Certificate from CA.
- c. Obtaining Trusted Root/Intermediate Certificate from CA.
- d. Deploying Device and Trusted Root/Intermediate Certificates on SBC.

Note: The domain portion of the Common Name (CN) must match the SIP suffix configured for Office 365 users.

➤ **To configure a certificate:**

1. Open the TLS Contexts page (**Setup** menu > **IP Network** tab > **Security** folder > **TLS Contexts**).
2. In the TLS Contexts page, select the required TLS Context index row, and then click the **Change Certificate** link located below the table; the Context Certificates page appears.
3. Under the **Certificate Signing Request** group, do the following:
 - a. In the 'Subject Name [CN]' field, enter the SBC FQDN name (based on example above, **ACeducation.info**).
 - b. Change the 'Private Key Size' based on the requirements of your Certification Authority. Many CAs do not support private key of size 1024. In this case, you must change the key size to 2048.
 - c. To change the key size on TLS Context, go to: **Generate New Private Key and Self-Signed Certificate**, change the 'Private Key Size' to **2048** and then click **Generate Private-Key**. To use **1024** as a Private Key Size value, you can click **Generate Private-Key** without changing the default key size value.
 - d. Fill in the rest of the request fields according to your security provider's instructions.
 - e. Click the **Create CSR** button; a textual certificate signing request is displayed in the area below the button:

Figure 4-7: Example of Certificate Signing Request – Creating CSR

(TLS Context [#0] > Change Certificates

-----END CERTIFICATE REQUEST-----
```

GENERATE NEW PRIVATE KEY AND SELF-SIGNED CERTIFICATE

Private Key Size	2048
Private key pass-phrase (optional)	*****

Press the "Generate Private Key" button to create new private key.
 Press the "Generate Self-Signed Certificate" button to create self-signed certificate.
 Note that the certificate will use the subject name configured in "Certificate Signing Request" box.
 Important: generation of private key is a lengthy operation during which the device service may be affected.

Generate Private-Key **Generate Self-Signed Certificate**

4. Copy the CSR from the line "**-----BEGIN CERTIFICATE REQUEST-----**" to "**END CERTIFICATE REQUEST-----**" to a text file (such as Notepad), and then save it to a folder on your computer with the file name, for example *certreq.txt*.
5. Send *certreq.txt* file to the Certified Authority Administrator for signing.
6. After obtaining an SBC signed and Trusted Root/Intermediate Certificate from the CA, in the SBC's Web interface, return to the **TLS Contexts** page and do the following:
 - a. In the TLS Contexts page, select the required TLS Context index row, and then click the **Change Certificate** link located below the table; the Context Certificates page appears.
 - b. Scroll down to the **Upload certificates files from your computer** group, click the **Choose File** button corresponding to the 'Send Device Certificate...' field, navigate to the certificate file obtained from the CA, and then click **Load File** to upload the certificate to the SBC.

Figure 4-8: Uploading the Certificate Obtained from the Certification Authority

UPLOAD CERTIFICATE FILES FROM YOUR COMPUTER

Private key pass-phrase (*optional*)

Send **Private Key** file from your computer to the device.
The file must be in either PEM or PFX (PKCS#12) format.

No file chosen

Note: Replacing the private key is not recommended but if it's done, it should be over a physically-secure network link.

Send **Device Certificate** file from your computer to the device.
The file must be in textual PEM format.

No file chosen ←

7. Confirm that the certificate was uploaded correctly. A message indicating that the certificate was uploaded successfully is displayed in blue in the lower part of the page.
8. In the SBC's Web interface, return to the **TLS Contexts** page, select the required TLS Context index row, and then click the **Certificate Information** link, located at the bottom of the TLS. Then validate the Key size, certificate status and Subject Name:

Figure 4-9: Certificate Information Example

9. In the SBC's Web interface, return to the **TLS Contexts** page.
 - a. In the TLS Contexts page, select the required TLS Context index row, and then click the **Trusted Root Certificates** link, located at the bottom of the TLS Contexts page; the Trusted Certificates page appears.
 - b. Click the **Import** button, and then select all Root/Intermediate Certificates obtained from your Certification Authority to load.
10. Click **OK**; the certificate is loaded to the device and listed in the Trusted Certificates store.

Figure 4-10: Example of Configured Trusted Root Certificates

INDEX	SUBJECT	ISSUER	EXPIRES
0	DigiCert Global Root CA	DigiCert Global Root CA	11/10/2031
1	RapidSSL RSA CA 2018	DigiCert Global Root CA	11/06/2027

11. Reset the SBC by clicking **Save To Flash** for your settings to take effect.

4.3.4 Alternative Method of Generating and Installing the Certificate

To use the same certificate on multiple devices, you may prefer using [DigiCert Certificate Utility for Windows](#) to process the certificate request from your Certificate Authority on another machine, with this utility installed.

After you've processed the certificate request and response using the DigiCert utility, test the certificate private key and chain and then export the certificate with private key and assign a password.

➤ **To install the certificate:**

1. Open the TLS Contexts page (**Setup** menu > **IP Network** tab > **Security** folder > **TLS Contexts**).
2. In the TLS Contexts page, select the required TLS Context index row, and then click the **Change Certificate** link located below the table; the Context Certificates page appears.
3. Scroll down to the **Upload certificates files from your computer** group and do the following:
 - a. Enter the password assigned during export with the DigiCert utility in the '**Private key pass-phrase**' field.
 - b. Click the **Choose File** button corresponding to the '**Send Private Key...**' field and then select the SBC certificate file exported from the DigiCert utility.

4.3.5 Deploy Baltimore Trusted Root Certificate

The DNS name of the Microsoft Teams Direct Routing interface is **sip.pstnhub.microsoft.com**. In this interface, a certificate is presented which is signed by Baltimore Cyber Baltimore CyberTrust Root with Serial Number: 02 00 00 b9 and SHA fingerprint: d4:de:20:d0:5e:66:fc: 53:fe:1a:50:88:2c:78:db:28:52:ca:e4:74.

To trust this certificate, your SBC *must* have the certificate in Trusted Certificates storage. Download the certificate from <https://cacert.omniroot.com/bc2025.pem> and follow the steps above to import the certificate to the Trusted Root storage.

Note: Before importing the Baltimore Root Certificate into AudioCodes' SBC, make sure it's in .PEM or .PFX format. If it isn't, you need to convert it to .PEM or .PFX format. Otherwise, you will receive a 'Failed to load new certificate' error message. To convert to PEM format, use the Windows local store on any Windows OS and then export it as 'Base-64 encoded X.509 (.CER) certificate'.

4.4 Configure Media Realms

This step describes how to configure Media Realms. The simplest configuration is to create two Media Realms - one for internal (LAN) traffic and one for external (WAN) traffic.

➤ **To configure Media Realms:**

1. Open the Media Realms table (**Setup** menu > **Signaling & Media** tab > **Core Entities** folder > **Media Realms**).
2. Add a Media Realm for the LAN interface. You can use the default Media Realm (Index 0), but modify it as shown below:

Parameter	Value
Index	0
Name	MRLan (descriptive name)
IPv4 Interface Name	LAN_IF
Port Range Start	6000 (represents lowest UDP port number used for media on LAN)
Number of Media Session Legs	100 (media sessions assigned with port range)

Figure 4-11: Configuring Media Realm for LAN

Media Realms [MRLan]

GENERAL		QUALITY OF EXPERIENCE	
Index	0	QoE Profile	-- View
Name	MRLan	Bandwidth Profile	-- View
Topology Location	Down		
IPv4 Interface Name	#0 [LAN_IF] View		
Port Range Start	6000		
Number Of Media Session Legs	100		
Port Range End	6999		
Default Media Realm	No		

Cancel **APPLY**

3. Configure a Media Realm for WAN traffic:

Parameter	Value
Index	1
Name	MRWan (arbitrary name)
Topology Location	Up
IPv4 Interface Name	WAN_IF
Port Range Start	7000 (represents lowest UDP port number used for media on WAN)
Number of Media Session Legs	100 (media sessions assigned with port range)

Figure 4-12: Configuring Media Realm for WAN

Media Realms [MRWan]

GENERAL		QUALITY OF EXPERIENCE	
Index	<input type="text" value="1"/>	QoE Profile	-- View
Name	• <input type="text" value="MRWan"/>	Bandwidth Profile	-- View
Topology Location	• <input type="text" value="Up"/>		
IPv4 Interface Name	• <input type="text" value="#1 [WAN_IF]"/> View		
Port Range Start	• <input type="text" value="7000"/>		
Number Of Media Session Legs	• <input type="text" value="100"/>		
Port Range End	<input type="text" value="7999"/>		
Default Media Realm	• <input type="text" value="No"/>		

[Cancel](#) [APPLY](#)

The configured Media Realms are shown in the figure below:

Figure 4-13: Configured Media Realms in Media Realm Table

Media Realms (2)						
	+ New	Edit	Delete	Page 1 of 1	Show 10 records per page	Search
INDEX	NAME	IPV4 INTERFACE NAME	PORT RANGE START	NUMBER OF MEDIA SESSION LEGS	PORT RANGE END	DEFAULT MEDIA REALM
0	MRLan	LAN_IF	6000	100	6999	No
1	MRWan	WAN_IF	7000	100	7999	No

4.5 Configure SIP Signaling Interfaces

This step describes how to configure SIP Interfaces. For the interoperability test topology, internal (towards the SIP Trunk) and external (towards the Teams Direct Routing Interface) SIP Interfaces must be configured for the SBC.

➤ **To configure SIP Interfaces:**

1. Open the SIP Interfaces table (**Setup** menu > **Signaling & Media** tab > **Core Entities** folder > **SIP Interfaces**).
2. Add a SIP Interface for the LAN interface. You can use the default SIP Interface (Index 0), but modify it as shown below:

Parameter	Value
Index	0
Name	SwisscomESIP (arbitrary descriptive name)
Network Interface	LAN_IF
Application Type	SBC
TCP Port	5060
UDP and TLS Port	0
Media Realm	MRLan

Note: The Direct Routing interface can only use TLS transport for a SIP. It does not support using TCP due to security reasons. The SIP port may be any port of your choice. When pairing the SBC with Office 365, the chosen port is specified in the pairing command.

3. Configure a SIP Interface for the WAN.

Parameter	Value
Index	1
Name	Teams (arbitrary descriptive name)
Network Interface	WAN_IF
Application Type	SBC
UDP and TCP Port	0
TLS Port	5061 (as configured in the Office 365)
Enable TCP Keepalive	Enable
Classification Failure Response Type	0
Media Realm	MRWan

The configured SIP Interfaces are shown in the figure below:

Figure 4-14: Configured SIP Interfaces in SIP Interface Table

SIP Interfaces (2)									
		+ New	Edit	Delete	Page	1 of 1	Show	10	records per page
INDEX	NAME	SRD	NETWORK INTERFACE	APPLICATION TYPE	UDP PORT	TCP PORT	TLS PORT	ENCAPSULATION PROTOCOL	MEDIA REALM
0	SwisscomESIP	DefaultSRD	LAN_IF	SBC	0	5060	0	No encapsulation	MRLan
1	Teams	DefaultSRD	WAN_IF	SBC	0	0	5061	No encapsulation	MRWan

4.6 Configure Proxy Sets

This step describes how to configure Proxy Sets. The Proxy Set defines the destination address (IP address or FQDN) of the IP entity server. Proxy Sets can also be used to configure load balancing between multiple servers.

For the interoperability test topology, two Proxy Sets need to be configured for the following IP entities:

- Swisscom SIP Trunk
- Microsoft Teams Direct Routing

The Proxy Sets will later be applied to the VoIP network by assigning them to IP Groups.

➤ **To configure Proxy Sets:**

1. Open the Proxy Sets table (**Setup** menu > **Signaling & Media** tab > **Core Entities** folder > **Proxy Sets**).
2. Add a Proxy Set for the Swisscom SIP Trunk:

Parameter	Value
Index	1
Name	SwisscomESIP
SBC IPv4 SIP Interface	SwisscomESIP
Proxy Keep-Alive	Using Options
Proxy Keep-Alive Time [sec]	10

Figure 4-15: Configuring Proxy Set for Swisscom SIP Trunk

The screenshot shows the 'Proxy Sets [SwisscomESIP]' configuration window. At the top, there is a dropdown for 'SRD' set to '#0 [DefaultSRD]'. The window is divided into several tabs: GENERAL, REDUNDANCY, ADVANCED, and KEEP ALIVE. In the GENERAL tab, the 'Index' is set to 1, 'Name' is set to 'SwisscomESIP', 'Gateway IPv4 SIP Interface' is set to '--', 'SBC IPv4 SIP Interface' is set to '#0 [SwisscomESIP]', and 'TLS Context Name' is set to '--'. In the REDUNDANCY tab, 'Redundancy Mode' is set to 'None', 'Proxy Hot Swap' is set to 'Disable', 'Proxy Load Balancing Method' is set to 'None', and 'Min. Active Servers for Load Balancing' is set to 1. In the ADVANCED tab, 'Classification Input' is set to 'IP Address only', and 'DNS Resolve Method' is set to 'None'. In the KEEP ALIVE tab, 'Proxy Keep-Alive' is set to 'Using OPTIONS', 'Proxy Keep-Alive Time [sec]' is set to 10, and 'Keep-Alive Failure Responses' is set to 1. At the bottom right, there are 'Cancel' and 'APPLY' buttons.

- a. Select the index row of the Proxy Set that you added, and then click the **Proxy Address** link located below the table; the Proxy Address table opens.

- b. Click **New**; the following dialog box appears:

Figure 4-16: Configuring Proxy Address for Swisscom SIP Trunk

- c. Configure the address of the Proxy Set according to the parameters described in the table below.

Parameter	Value
Index	0
Proxy Address	10.20.0.10:5060 (IP address / FQDN and destination port)
Transport Type	TCP

- d. Click **Apply**.

3. Add a Proxy Set for the Teams Direct Routing as shown below:

Parameter	Value
Index	2
Name	Teams (arbitrary descriptive name)
SBC IPv4 SIP Interface	Teams
Proxy Keep-Alive	Using Options
Proxy Hot Swap	Enable
Proxy Load Balancing Method	Random Weights
DNS Resolve Method	SRV

Figure 4-17: Configuring Proxy Set for Microsoft Teams Direct Routing

- Select the index row of the Proxy Set that you added, and then click the **Proxy Address** link located below the table; the Proxy Address table opens.
- Click **New**; the following dialog box appears:

Figure 4-18: Configuring Proxy Address for Microsoft Teams Direct Routing Interface

- Configure the address of the Proxy Set according to the parameters described in the table below.

Parameter	Value
Index	0
Proxy Address	teams.local (Teams Direct Routing FQDN)
Transport Type	TLS

- Click **Apply**.

The configured Proxy Sets are shown in the figure below:

Figure 4-19: Configured Proxy Sets in Proxy Sets Table

Proxy Sets (3)							
	+ New	Edit	Delete	Page 1 of 1	Show 10 records per page	Search	Filter
INDEX	NAME	SRD	GATEWAY IPV4 SIP INTERFACE	SBC IPV4 SIP INTERFACE	PROXY KEEP-ALIVE TIME [SEC]	REDUNDANCY MODE	PROXY HOT SWAP
0	ProxySet_0	DefaultSRD (#0)	--	SwisscomESIP	60		Disable
1	SwisscomESIP	DefaultSRD (#0)	--	SwisscomESIP	10		Disable
2	Teams	DefaultSRD (#0)	--	Teams	60		Enable

4.7 Configure the Internal SRV Table

The Internal SRV table resolves host names to DNS A-Records. Three different A-Records can be assigned to each host name, where each A-Record contains the host name, priority, weight, and port.

➤ **To configure the Internal SRV Table:**

1. Open the Internal SRV table (**Setup** menu > **IP Network** tab > **DNS** folder > **Internal SRV**).
2. Click **New** to add the SRV record for **teams.local** and use the table below as configuration reference.

Table 4-1: Configuration Example of the Internal SRV Table

Parameter	Value
Domain Name	teams.local (FQDN is case-sensitive; configure in line with the configuration of the Teams Proxy Set)
Transport Type	TLS
1st ENTRY	
DNS Name 1	sip.pstnhub.microsoft.com
Priority 1	1
Weight 1	1
Port 1	5061
2nd ENTRY	
DNS Name 2	sip2.pstnhub.microsoft.com
Priority 2	2
Weight 2	1
Port 2	5061
3rd ENTRY	
DNS Name 3	sip3.pstnhub.microsoft.com
Priority 3	3
Weight 3	1
Port 3	5061

Figure 4-20: Example of the Internal SRV Table

The screenshot shows the AudioCodes M800B web interface under the 'IP NETWORK' tab. On the left, a navigation menu includes 'CORE ENTITIES', 'SECURITY', 'QUALITY', 'DNS' (selected), 'WEB SERVICES', 'HTTP PROXY', 'RADIUS & LDAP', and 'ADVANCED'. Under 'DNS', 'Internal DNS (0)' and 'Internal SRV (1)' are listed, with 'Internal SRV (1)' selected. The main panel displays the 'Internal SRV (1)' table with one entry:

INDEX	DOMAIN NAME	TRANSPORT TYPE	DNS NAME 1	DNS NAME 2	DNS NAME 3
0	teams.local	TLS	sip.pstnhub.microsoft.com	sip2.pstnhub.microsoft.com	sip3.pstnhub.microsoft.com

Below the table, three detailed entries are shown:

- #0**:
 - GENERAL**: Domain Name: teams.local, Transport Type: TLS.
 - 1ST ENTRY**: DNS Name 1: sip.pstnhub.microsoft.com, Priority 1: 1, Weight 1: 1, Port 1: 5061.
 - 2ND ENTRY**: DNS Name 2: sip2.pstnhub.microsoft.com, Priority 2: 2, Weight 2: 1, Port 2: 5061.
 - 3RD ENTRY**: DNS Name 3: sip3.pstnhub.microsoft.com, Priority 3: 3, Weight 3: 1, Port 3: 5061.

4.8 Configure Coders

This step describes how to configure coders (termed *Coder Group*). As Teams Direct Routing supports the SILK and OPUS coders while the network connection to Swisscom SIP Trunk may restrict operation with a dedicated coders list, you need to add a Coder Group with the supported coders for each leg, the Teams Direct Routing and the Swisscom SIP Trunk.

Note that the Coder Group ID for this entity will be assigned to its corresponding IP Profile in the next step.

➤ **To configure coders:**

1. Open the Coder Groups table (**Setup** menu > **Signaling & Media** tab > **Coders & Profiles** folder > **Coder Groups**).
2. Configure a Coder Group for Teams Direct Routing:

Parameter	Value
Coder Group Name	AudioCodersGroups_1
Coder Name	<ul style="list-style-type: none"> ▪ SILK-NB ▪ SILK-WB ▪ G.711 A-law ▪ G.711 U-law ▪ G.729

Figure 4-21: Configuring Coder Group for Teams Direct Routing

The screenshot shows a software interface titled 'Coder Groups'. At the top, there is a search bar labeled 'Coder Group Name' with the value '1 : AudioCodersGroups_1' and a 'Delete Group' button. Below the search bar is a table with the following columns: Coder Name, Packetization Time, Rate, Payload Type, Silence Suppression, and Coder Specific. The table contains five rows, each representing a different coder: SILK-NB, SILK-WB, G.711A-law, G.711U-law, and G.729. Each row has dropdown menus for its respective columns.

Coder Name	Packetization Time	Rate	Payload Type	Silence Suppression	Coder Specific
SILK-NB	20	8	103	N/A	
SILK-WB	20	16	104	N/A	
G.711A-law	20	64	8	Disabled	
G.711U-law	20	64	0	Disabled	
G.729	20	8	18	Disabled	

The procedure below describes how to configure an Allowed Coders Group to ensure that voice sent to the Swisscom SIP Trunk uses the dedicated coders list whenever possible. Note that this Allowed Coders Group ID will be assigned to the IP Profile belonging to the Swisscom SIP Trunk in the next step.

➤ **To set a preferred coder for the Swisscom SIP Trunk:**

1. Open the Allowed Audio Coders Groups table (**Setup** menu > **Signaling & Media** tab > **Coders & Profiles** folder > **Allowed Audio Coders Groups**).
2. Click **New** and configure a name for the Allowed Audio Coders Group for Swisscom SIP Trunk.

Figure 4-22: Configuring Allowed Coders Group for Swisscom SIP Trunk

The screenshot shows a configuration interface for an 'Allowed Audio Coders Groups' entry named 'Swisscom-AllowedAudioCoders'. The 'GENERAL' tab is selected, displaying two fields: 'Index' (set to 0) and 'Name' (set to 'Swisscom-AllowedAudioCoders').

3. Click **Apply**.
4. Select the new row that you configured, and then click the **Allowed Audio Coders** link located below the table; the Allowed Audio Coders table opens.
5. Click **New** and configure an Allowed Coders as follows:

Parameter	Value
Index	0
Coder	G.711 A-law
Index	1
Coder	G.729
Index	2
Coder	G.722

Figure 4-23: Configuring Allowed Coders for Swisscom SIP Trunk

The screenshot shows a configuration interface for an 'Allowed Audio Coders' entry. The 'GENERAL' tab is selected, displaying three fields: 'Index' (set to 0), 'Coder' (set to 'G.711 A-law'), and 'User-defined Coder' (empty). A dropdown arrow is visible next to the 'Coder' field.

6. Open the Media Settings page (**Setup** menu > **Signaling & Media** tab > **Media** folder > **Media Settings**).

Figure 4-24: SBC Preferences Mode

The screenshot shows the 'Media Settings' configuration page. At the top left, it says 'Media Settings'. Below that are two tabs: 'GENERAL' and 'ROBUSTNESS'. Under 'GENERAL', there are several settings: 'NAT Traversal' (Disable NAT), 'Enable Continuity Tones' (Disable), 'Inbound Media Latch Mode' (Dynamic), 'Number of Media Channels' (0), 'Enforce Media Order' (Disable), and 'SDP Session Owner' (AudiocodesGW). To the right of these are corresponding numerical values: 'New RTP Stream Packets' (3), 'New RTCP Stream Packets' (3), 'New SRTP Stream Packets' (3), 'New SRTCP Stream Packets' (3), 'Timeout To Relatch RTP (msec)' (200), 'Timeout To Relatch SRTP (msec)' (200), 'Timeout To Relatch Silence (msec)' (10000), and 'Timeout To Relatch RTCP (msec)' (10000). Below this is a 'SBC SETTINGS' section with 'Preferences Mode' set to 'Include Extensions' (indicated by a red arrow pointing to it) and 'Enforce Media Order' (Disable). At the bottom is a 'GATEWAY SETTINGS' section with 'Enable Early Media' (Disable) and 'Multiple Packetization Time Format' (None). At the very bottom are 'Cancel' and 'APPLY' buttons.

7. From the 'Preferences Mode' drop-down list, select **Include Extensions**.
8. Click **Apply**.

4.9 Configure IP Profiles

This step describes how to configure IP Profiles. The IP Profile defines a set of call capabilities relating to signaling (e.g., SIP message terminations such as REFER) and media (e.g., coder and transcoding method).

In this interoperability test topology, IP Profiles need to be configured for the following IP entities:

- Swisscom SIP trunk – to operate in non-secure mode using RTP and SIP over TCP
- Microsoft Teams Direct Routing – to operate in secure mode using SRTP and SIP over TLS

➤ To configure an IP Profile for the Swisscom SIP Trunk:

1. Click **New**, and then configure the parameters as follows:

Parameter	Value
General	
Index	1
Name	Swisscom
Media Security	
SBC Media Security Mode	RTP
SBC Media	
Allowed Audio Coders	Swisscom-AllowedAudioCoders
Allowed Coders Mode	Restriction and Preference (reorganize coders according to Allowed Coders list and restrict all other)
SBC Signaling	
P-Asserted-Identity Header Mode	Add (required for anonymous calls)
SBC Forward and Transfer	
Remote REFER Mode	Handle Locally
Remote Replaces Mode	Handle Locally
Play RBT To Transferee	Yes
Remote 3xx Mode	Handle Locally
SBC Hold	
Remote Hold Format	Send Only

Figure 4-25: Configuring IP Profile for Swisscom SIP Trunk

2. Click **Apply**.

➤ **To configure IP Profile for the Teams Direct Routing:**

1. Open the IP Profiles table (**Setup** menu > **Signaling & Media** tab > **Coders & Profiles** folder > **IP Profiles**).
2. Click **New**, and then configure the parameters as follows:

Parameter	Value
General	
Index	2
Name	Teams (arbitrary descriptive name)
Media Security	
SBC Media Security Mode	SRTP
SBC Early Media	
Remote Early Media RTP Detection Mode	By Media (required, as Teams Direct Routing does not send RTP immediately to remote side when it sends a SIP 18x response)
Generate RTP	Until RTP Detected
SBC Media	
Extension Coders Group	AudioCodersGroups_1
ICE Mode	Lite (required only when Media Bypass enabled on Teams)

SBC Signaling	
Remote re-INVITE Support	Supported Only With SDP
Remote Delayed Offer Support	Not Supported
SBC Forward and Transfer	
Remote REFER Mode	Handle Locally
Remote 3xx Mode	Handle Locally

Figure 4-26: Configuring IP Profile for Teams Direct Routing

The screenshot shows the 'IP Profiles [Teams]' configuration window. It has two main tabs: 'GENERAL' and 'SBC SIGNALING'. The 'GENERAL' tab contains fields for Index (2), Name (Teams), and Created by Routing Server (No). The 'SBC SIGNALING' tab contains various configuration options under 'PRACK Mode' (Transparent), 'P-Asserted-Identity Header Mode' (As Is), 'Diversion Header Mode' (As Is), 'History-Info Header Mode' (As Is), 'Session Expires Mode' (Transparent), 'Remote Update Support' (Supported), 'Remote re-INVITE' (Supported only with SDP), 'Remote Delayed Offer Support' (Not Supported), 'Remote Representation Mode' (According to Operation Mode), 'Keep Incoming Via Headers' (According to Operation Mode), 'Keep Incoming Routing Headers' (According to Operation Mode), and 'Keep User-Agent Header' (According to Operation Mode). At the bottom right are 'Cancel' and 'APPLY' buttons.

3. Click Apply.

4.10 Configure IP Groups

This step describes how to configure IP Groups. The IP Group represents an IP entity on the network with which the SBC communicates. This can be a server (e.g., IP-PBX or SIP Trunk) or it can be a group of users (e.g., LAN IP phones). For servers, the IP Group is typically used to define the server's IP address by associating it with a Proxy Set. Once IP Groups are configured, they are used to configure IP-to-IP routing rules for denoting source and destination of the call.

In this interoperability test topology, IP Groups must be configured for the following IP entities:

- Swisscom SIP Trunk located on LAN
- Teams Direct Routing located on WAN

➤ **To configure IP Groups:**

1. Open the IP Groups table (**Setup** menu > **Signaling & Media** tab > **Core Entities** folder > **IP Groups**).
2. Configure an IP Group for the Swisscom SIP Trunk:

Parameter	Value
Index	1
Name	SwisscomESIP
Type	Server
Proxy Set	SwisscomESIP
IP Profile	Swisscom
Media Realm	MRLan
SIP Group Name	10.20.0.10 (according to requirement)

3. Configure an IP Group for the Teams Direct Routing:

Parameter	Value
Index	2
Name	Teams
Topology Location	Up
Type	Server
Proxy Set	Teams
IP Profile	Teams
Media Realm	MRWan
SIP Group Name	teams-sbc.your.domain.com (according to requirement)
Classify By Proxy Set	Disable
Local Host Name	teams-sbc.your.domain.com (FQDN name of your tenant in the SBC)
Always Use Src Address	Yes
DTLS Context	default (TLS context, configured in Section 4.3.2)

The configured IP Groups are shown in the figure below:

Figure 4-27: Configured IP Groups in IP Group Table

IP Groups (3)												
INDEX		NAME	SRD	TYPE	SBC OPERATION MODE	PROXY SET	IP PROFILE	MEDIA REALM	SIP GROUP NAME	CLASSIFY BY PROXY SET	INBOUND MESSAGE MANIPULATION SET	OUTBOUND MESSAGE MANIPULATION SET
0	Default_JPG	DefaultSRD (Server	Not Configured	ProxySet_0	--	--			Disable	-1	-1
1	SwisscomESIP	DefaultSRD (Server	Not Configured	SwisscomESIP	Swisscom	MR-SIPTrunk	10.20.0.10	Enable	-1	4	
2	Teams	DefaultSRD (Server	Not Configured	Teams	Teams	MR-Teams	teams-sbc.your.c	Disable	-1	-1	

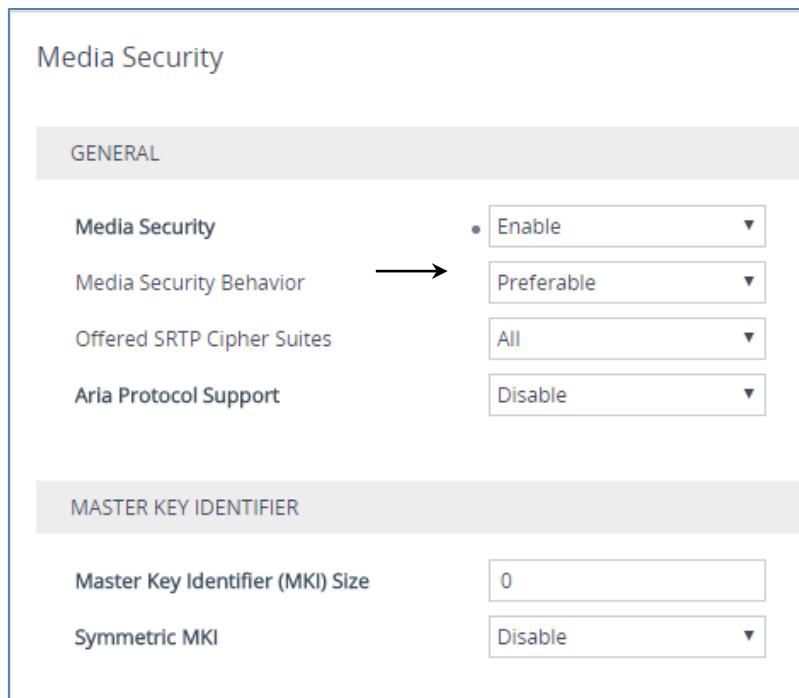

4.11 Configure SRTP

This step describes how to configure media security. The Direct Routing Interface needs to use SRTP only, so you need to configure the SBC to operate in the same manner.

➤ **To configure media security:**

1. Open the Media Security page (**Setup** menu > **Signaling & Media** tab > **Media** folder > **Media Security**).

Figure 4-28: Configuring SRTP

2. From the 'Media Security' drop-down list, select **Enable** to enable SRTP.
3. Click **Apply**.

4.12 Configuring Message Condition Rules

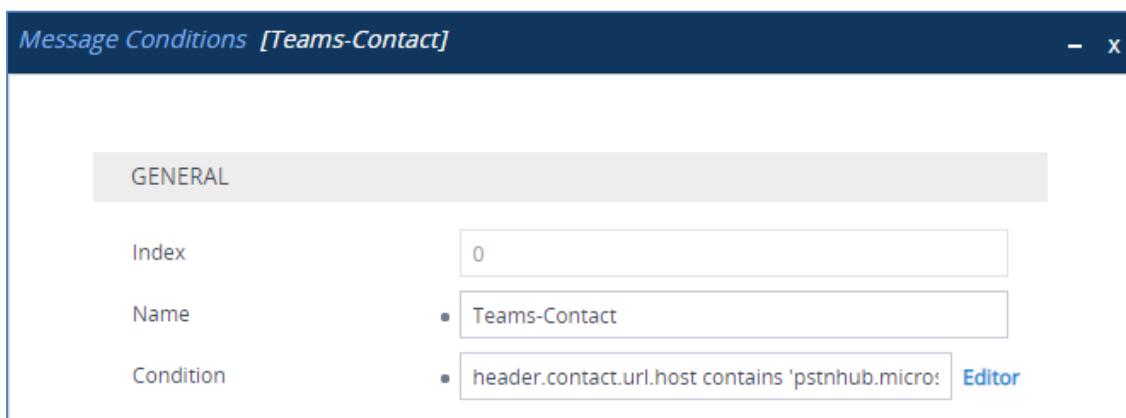

This step describes how to configure the Message Condition Rules. A Message Condition defines special conditions (pre-requisites) for incoming SIP messages. These rules can be used as additional matching criteria for the IP-to-IP routing rules in the IP-to-IP Routing table. Following Condition verifies that the Contact header contains Teams FQDN.

➤ **To configure a Message Condition rule:**

1. Open the Message Conditions table (**Setup** menu > **Signaling & Media** tab > **Message Manipulation** folder > **Message Conditions**).
2. Click **New**, and then configure the parameters as follows:

Parameter	Value
Index	0
Name	Teams-Contact (arbitrary descriptive name)
Condition	header.contact.url.host contains 'pstnhub.microsoft.com'

Figure 4-29: Configuring Condition Table

3. Click **Apply**.

4.13 Configuring Classification Rules

This step describes how to configure Classification rules. A Classification rule classifies incoming SIP dialog-initiating requests (e.g., INVITE messages) to a 'source' IP Group. The source IP Group is the SIP entity that sent the SIP dialog request. Once classified, the device uses the IP Group to process the call (manipulation and routing).

You can also use the Classification table for employing SIP-level access control for successfully classified calls, by configuring Classification rules with whitelist and blacklist settings. If a Classification rule is configured as a whitelist ("Allow"), the device accepts the SIP dialog and processes the call. If the Classification rule is configured as a blacklist ("Deny"), the device rejects the SIP dialog.

➤ **To configure a Classification Rules:**

1. Open the Classification table (**Setup** menu > **Signaling & Media** tab > **SBC** folder > **Classification Table**).
2. Click **New**, and then configure the parameters as follows:

Parameter	Value
Index	0
Name	Teams
Source SIP Interface	Teams
Destination Host	teams-sbc.your.domain.com
Message Condition	Teams-Contact
Action Type	Allow
Source IP Group	Teams

Figure 4-30: Configuring Classification Rule

The screenshot shows the 'Classification [Teams]' configuration dialog. The 'MATCH' section contains fields for Index (1), Name (Teams), Source SIP Interface (#1 [Teams]), Source IP Address, Source Transport Type (Any), Source Port (0), Source Username Pattern (*), Source Host (*), Destination Username Pattern (*), and Destination Host (teams-sbc.your.domain.com). The 'ACTION' section contains fields for Action Type (Allow), Destination Routing Policy (dropdown with 'View' button), Source IP Group (#2 [Teams]), and IP Profile (dropdown with 'View' button). The 'SRD' dropdown at the top is set to '#0 [DefaultSRD]'. At the bottom are 'Cancel' and 'APPLY' buttons.

3. Click **Apply**.

4.14 Configure IP-to-IP Call Routing Rules

This step describes how to configure IP-to-IP call routing rules. These rules define the routes for forwarding SIP messages (e.g., INVITE) received from one IP entity to another. The SBC selects the rule whose configured input characteristics (e.g., IP Group) match those of the incoming SIP message. If the input characteristics do not match the first rule in the table, they are compared to the second rule, and so on, until a matching rule is located. If no rule is matched, the message is rejected. The routing rules use the configured IP Groups (as configured in Section 4.10 on page 37,) to denote the source and destination of the call.

For the interoperability test topology, the following IP-to-IP routing rules need to be configured to route calls between Teams Direct Routing (WAN) and Swisscom SIP Trunk (LAN):

- Terminate SIP OPTIONS messages on the SBC that are received from the both LAN and DMZ
- Terminate REFER messages to Teams Direct Routing
- Calls from Teams Direct Routing to Swisscom SIP Trunk
- Calls from Swisscom SIP Trunk to Teams Direct Routing

➤ **To configure IP-to-IP routing rules:**

1. Open the IP-to-IP Routing table (**Setup** menu > **Signaling & Media** tab > **SBC** folder > **Routing** > **IP-to-IP Routing**).
2. Configure a rule to terminate SIP OPTIONS messages received from the both LAN and DMZ:
 - a. Click **New**, and then configure the parameters as follows:

Parameter	Value
Index	0
Name	Terminate OPTIONS (arbitrary descriptive name)
Source IP Group	Any
Request Type	OPTIONS
Destination Type	Dest Address
Destination Address	internal

Figure 4-31: Configuring IP-to-IP Routing Rule for Terminating SIP OPTIONS

The screenshot shows the 'IP-to-IP Routing [Terminate OPTIONS]' configuration dialog. The 'GENERAL' tab is active, showing the following settings:

- Index: 0
- Name: Terminate OPTIONS
- Alternative Route Options: Route Row

The 'ACTION' tab shows the following settings:

- Destination Type: Dest Address
- Destination IP Group: ..
- Destination SIP Interface: ..
- Destination Address: internal
- Destination Port: 0
- Destination Transport Type: (dropdown menu)
- IP Group Set: ..
- Call Setup Rules Set ID: -1
- Group Policy: Sequential
- Cost Group: ..

The 'MATCH' tab shows the following settings:

- Source IP Group: Any
- Request Type: OPTIONS
- Source Username Pattern: *
- Source Host: *
- Source Tag:

At the bottom of the dialog are 'Cancel' and 'APPLY' buttons.

- b. Click **Apply**.

3. Configure a rule to terminate REFER messages to Teams Direct Routing:
- a. Click **New**, and then configure the parameters as follows:

Parameter	Value
Index	1
Route Name	Refer from Teams (arbitrary descriptive name)
Source IP Group	Any
Call Trigger	REFER
ReRoute IP Group	Teams
Destination Type	Request URI
Destination IP Group	Teams

Figure 4-32: Configuring IP-to-IP Routing Rule for REFER from Teams

- b. Click **Apply**.

4. Configure a rule to route calls from Teams Direct Routing to Swisscom SIP Trunk:
 - a. Click **New**, and then configure the parameters as follows:

Parameter	Value
Index	2
Route Name	Teams to SwisscomESIP (arbitrary descriptive name)
Source IP Group	Teams
Destination Type	IP Group
Destination IP Group	SwisscomESIP

Figure 4-33: Configuring IP-to-IP Routing Rule for Teams to SwisscomESIP

The screenshot shows the 'IP-to-IP Routing [Teams to SwisscomESIP]' configuration dialog. At the top, the 'Routing Policy' dropdown is set to '#0 [Default_SBCRoutingPolicy]'. The dialog is divided into several sections: **GENERAL** (Index: 2, Name: 'Teams to SwisscomESIP', Alternative Route Options: 'Route Row'), **ACTION** (Destination Type: 'IP Group', Destination IP Group: '#1 [SwisscomESIP]', Destination SIP Interface: '--', Destination Address: '', Destination Port: '0', Destination Transport Type: '', IP Group Set: '--', Call Setup Rules Set ID: '-1', Group Policy: 'Sequential', Cost Group: '--'), and **MATCH** (Source IP Group: '#2 [Teams]', Request Type: 'All', Source Username Pattern: '*', Source Host: '*', Source Tag: ''). At the bottom, there are 'Cancel' and 'APPLY' buttons.

4. Configure a rule to route calls from Teams Direct Routing to Swisscom SIP Trunk:
 - a. Click **New**, and then configure the parameters as follows:
 - b. Click **Apply**.

5. Configure rule to route calls from Swisscom SIP Trunk to Teams Direct Routing:
- Click **New**, and then configure the parameters as follows:

Parameter	Value
Index	3
Route Name	SwisscomESIP to Teams (arbitrary descriptive name)
Source IP Group	SwisscomESIP
Destination Type	IP Group
Destination IP Group	Teams

Figure 4-34: Configuring IP-to-IP Routing Rule for SwisscomESIP to Teams

The screenshot shows the 'IP-to-IP Routing [SwisscomESIP to Teams]' configuration dialog. At the top, the 'Routing Policy' dropdown is set to '#0 [Default_SBCRoutingPolicy]'. The dialog is divided into several sections:

- GENERAL:** Index is 4, Name is 'SwisscomESIP to Teams', Alternative Route Options is 'Route Row'.
- ACTION:** Destination Type is 'IP Group', Destination IP Group is '#2 [Teams]', Destination SIP Interface is '#1 [Teams]', Destination Address and Port are empty, Destination Transport Type is empty, IP Group Set is '--', Call Setup Rules Set ID is '-1', Group Policy is 'Sequential', and Cost Group is '--'.
- MATCH:** Source IP Group is '#1 [SwisscomESIP]', Request Type is 'All', Source Username Pattern is '*', Source Host is '*', and Source Tag is empty.
- Buttons at the bottom:** 'Cancel' and 'APPLY'.

- Click **Apply**.

The configured routing rules are shown in the figure below:

Figure 4-35: Configured IP-to-IP Routing Rules in IP-to-IP Routing Table

IP-to-IP Routing (4)													
		ROUTING POLICY		ALTERNATIVE ROUTE OPTIONS		SOURCE IP GROUP	REQUEST TYPE	SOURCE USERNAME PATTERN	DESTINATION USERNAME PATTERN	DESTINATION TYPE	DESTINATION IP GROUP	DESTINATION SIP INTERFACE	DESTINATION ADDRESS
INDEX	NAME	ROUTE ROW	ROUTE ROW	ROUTE ROW	ROUTE ROW								
0	Terminate OPT	Default_SBCRc	Route Row	Any	OPTIONS	*	*		Dest Address	--	--		internal
1	Refer from Teams	Default_SBCRc	Route Row	Any	All	*	*		Request URI	Teams	--		
2	Teams to SwisscomESIP	Default_SBCRc	Route Row	Teams	All	*	*		IP Group	SwisscomESIP	--		
4	SwisscomESIP	Default_SBCRc	Route Row	SwisscomESIP	All	*	*		IP Group	Teams	Teams		

Note: The routing configuration may change according to your specific deployment topology.

4.15 Configure Number Manipulation Rules

This step describes how to configure IP-to-IP manipulation rules. These rules manipulate the SIP Request-URI user part (source or destination number). The manipulation rules use the configured IP Groups (as configured in Section 4.10 on page 37) to denote the source and destination of the call.

Note: Adapt the manipulation table according to your environment dial plan.

For example, for this interoperability test topology, a manipulation is configured to introduce anonymous call when dialing “+41*31” prefix from any IP Group to the Swisscom SIP Trunk IP Group.

➤ **To configure a number manipulation rule:**

1. Open the Outbound Manipulations table (**Setup** menu > **Signaling & Media** tab > **SBC** folder > **Manipulation** > **Outbound Manipulations**).
2. Click **New**, and then configure the parameters as follows:

Parameter	Value
Index	0
Name	For Anonymous Calls
Source IP Group	Any
Destination IP Group	SwisscomESIP
Destination Username Prefix	+41*31
Manipulated Item	Source URI
Privacy Restriction Mode	Restrict

Figure 4-36: Configuring IP-to-IP Outbound Manipulation Rule

3. Click **Apply**.

The figure below shows an example of configured IP-to-IP outbound manipulation rules for calls to Swisscom SIP Trunk IP Group:

Figure 4-37: Configured IP-to-IP Outbound Manipulation Rules

Outbound Manipulations (2)													
INDEX	NAME	ROUTING POLICY	ADDITIONAL MANIPULATION	SOURCE IP GROUP	DESTINATION IP GROUP	SOURCE USERNAME PATTERN	DESTINATION USERNAME PATTERN	MANIPULATION ITEM	REMOVE FROM LEFT	REMOVE FROM RIGHT	LEAVE FROM RIGHT	PREFIX TO ADD	SUFFIX TO ADD
0	For Anonymous	Default_SBCI	No	Any	SwisscomESIP	*	+41*31	Source URI	0	0	255		
1	For Anonymous	Default_SBCI	No	Any	SwisscomESIP	*	+41*31	Destination	6	0	255		

Rule Index	Description
0	Calls from Any IP Group to SwisscomESIP IP Group with the prefix destination number "+41*31", apply restriction policy on the source number.
1	Calls from Any IP Group to SwisscomESIP IP Group with the prefix destination number "+41*31", remove 6 digits (+41*31) from this prefix.

4.16 Configure Message Manipulation Rules

This step describes how to configure SIP message manipulation rules. SIP message manipulation rules can include insertion, removal, and/or modification of SIP headers. Manipulation rules are grouped into Manipulation Sets, enabling you to apply multiple rules to the same SIP message (IP entity).

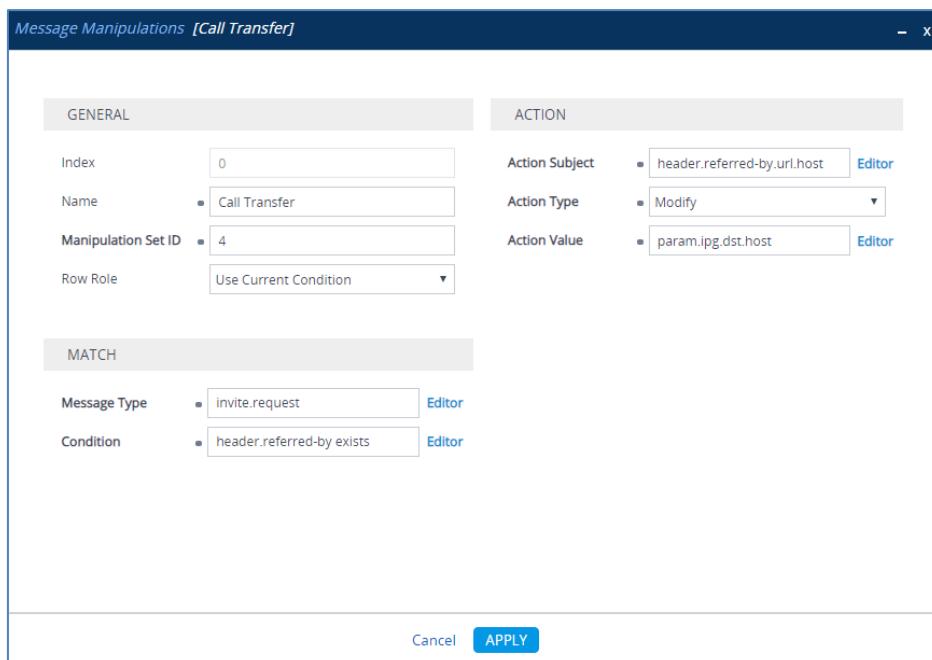

Once you have configured the SIP message manipulation rules, you need to assign them to the relevant IP Group (in the IP Group table) and determine whether they must be applied to inbound or outbound messages.

➤ **To configure SIP message manipulation rule:**

1. Open the Message Manipulations page (**Setup** menu > **Signaling & Media** tab > **Message Manipulation** folder > **Message Manipulations**).
2. Configure a new manipulation rule (Manipulation Set 4) for Swisscom the SIP Trunk. This rule applies to messages sent to the Swisscom SIP Trunk IP Group in a Call Transfer scenario. This rule replaces the host part of the SIP Referred-By header with the value taken from the 'Group Name' field of the Swisscom SIP Trunk IP Group.

Parameter	Value
Index	0
Name	Call Transfer
Manipulation Set ID	4
Message Type	invite.request
Condition	header.referred-by exists
Action Subject	header.referred-by.url.host
Action Type	Modify
Action Value	param.ipg.dst.host

Figure 4-38: Configuring SIP Message Manipulation Rule 0 (for Swisscom SIP Trunk)

3. If the manipulation rule Index 0 (above) is executed, then the following rule is also

executed. It adds the SIP Diversion header with values from the SIP Referred-by header.

Parameter	Value
Index	1
Name	Call Transfer
Manipulation Set ID	4
Row Role	Use Previous Condition
Message Type	
Condition	
Action Subject	header.diversion
Action Type	Add
Action Value	header.referred-by

<input type="button" value="Cancel"/> <input type="button" value="APPLY"/>					

8. Configure another manipulation rule (Manipulation Set 4) for Swisscom SIP Trunk. This rule is applied to response messages sent to the Swisscom SIP Trunk IP Group. Sometimes Swisscom SIP Trunk send two media streams in the SIP INVITE message – m=audio (for audio stream) and m=image (for T.38 fax stream). In the response message, when only audio call is answered, AudioCodes SBC send ‘m=image 0’ and ‘a=inactive’ to clarify that T.38 fax will not be used. But the Swisscom SIP Trunk requests to remove ‘a=inactive’ and leave only ‘m=image 0’.

Parameter	Value
Index	7
Name	Remove ‘a=inactive’
Manipulation Set ID	4
Message Type	any.response
Condition	body.sdp regex (.*)(m=image 0)(.*)(a=inactive)(.*)
Action Subject	body.sdp
Action Type	Modify

The table displayed below includes SIP message manipulation rules which are grouped together under Manipulation Set ID 4 and which are executed for messages sent to the Swisscom SIP Trunk IP. These rules are specifically required to enable proper interworking between Swisscom SIP Trunk and Microsoft Teams Direct Routing Interface. Refer to the *User's Manual* for further details concerning the full capabilities of header manipulation.

Rule Index	Rule Description	Reason for Introducing Rule
0	This rule applies to messages sent to the Swisscom SIP Trunk IP Group in a Call Transfer scenario. This rule replaces the host part of the SIP Referred-By header with the value taken from the 'Group Name' field of the Swisscom SIP Trunk IP Group.	For Call Transfer scenarios, Swisscom SIP Trunk request SIP Diversion header instead of SIP Referred-By header, sent from the Microsoft Teams.
1	If manipulation rule index above is executed, then the following rule is also executed. It adds the SIP Diversion header with values from the SIP Referred-by header.	
2	If manipulation rule index above is executed, then the following rule is also executed. It removes the SIP Referred-by header.	
3	This rule applies to messages sent to the Swisscom SIP Trunk IP Group in a call forward scenario. This rule adds the SIP Diversion header with the value from the SIP History-Info Header.	For Call Forward scenarios, Swisscom SIP Trunk request SIP Diversion header instead of SIP History-Info header, sent from the Microsoft Teams.
4	If the manipulation rule Index 3 (above) is executed, then the following rule is also executed. It normalizes the SIP Diversion header.	
5	If the manipulation rule Index 3 (above) is executed, then the following rule is also executed. It removes the SIP History-Info header.	
6	This rule applies to messages sent to the Swisscom SIP Trunk IP Group. This rule replaces the host part of the SIP Diversion header with the value that was configured in the Swisscom SIP Trunk IP Group as Group Name.	Swisscom SIP Trunk request that Host part of SIP Diversion header will be pre-configured.

Rule Index	Rule Description	Reason for Introducing Rule
7	This rule is applied to response messages sent to the Swisscom SIP Trunk IP Group. It removes 'a=inactive' from responses sent to the Swisscom SIP Trunk.	Swisscom The SIP Trunk sends two media streams in the SIP INVITE message – m=audio (for audio stream) and m=image (for T.38 fax stream). In the response message, when only the audio call is answered, the AudioCodes SBC sends 'm=image 0' and 'a=inactive' to clarify that T.38 fax will not be used. But the Swisscom SIP Trunk requests to remove 'a=inactive' and leave only 'm=image 0'.
8	This rule is applied to response messages sent to the Swisscom SIP Trunk IP Group for Call Forward of Anonymous Call initiated by the Microsoft Teams IP Group. This removes the user=phone variable from the SIP 'From' header.	
9	If the manipulation rule index above is executed, then the following rule is also executed. This rule is applied to response messages sent to the Swisscom SIP Trunk IP Group for Call Forward of Anonymous Call initiated by the Microsoft Teams IP Group. This adds the SIP Privacy header with value 'id'.	These rules are applied to normalize messages for Call Forward of an Anonymous Call initiated by the Microsoft Teams.
10	If the manipulation rule index above is executed, then the following rule is also executed. This rule replaces the user part of the SIP P-Asserted-Identity header with the value from the SIP Diversion header.	
11	If the manipulation rule index above is executed, then the following rule is also executed. This rule replaces the host part of the SIP 'From' header with the value 'anonymous.invalid'.	
12	This rule is applied to 200 OK response messages sent to the Swisscom SIP Trunk IP Group. This adds the SIP Require header with a value of 'timer' if the SIP Session Expire header exists.	
13	This rule is applied to all messages sent to the Swisscom SIP Trunk IP Group. This rule removes the Display Name.	
14	This rule is applied to all messages sent to the Swisscom SIP Trunk IP Group. This rule normalizes the SDP body of each message.	
15	This rule is applied to all messages sent to the Swisscom SIP Trunk IP Group. This rule replaces the host part of the SIP Request-URI header with the Destination IP address.	
16	This rule is applied to all messages sent to the Swisscom SIP Trunk IP Group. This rule replaces the host part of the SIP To header with destination IP address.	

Rule Index	Rule Description	Reason for Introducing Rule
17	This rule is applied to all messages sent to the Swisscom SIP Trunk IP Group. This rule replaces the host part of the SIP From header with the value from the SIP Contact header.	
18	This rule is applied to all messages sent to the Swisscom SIP Trunk IP Group. This replace the host part of the SIP P-Asserted-Identity header with the value from the SIP Contact header.	
19	This rule is applied to all messages sent to the Swisscom SIP Trunk IP Group. This remove 'ms-opaque' parameter from the SIP Contact header.	
20	This rule is applied to OPTIONS messages sent to the Swisscom SIP Trunk IP Group. This replace the host part of the SIP Request-URI header with destination IP address.	
21	This rule is applied to OPTIONS messages sent to the Swisscom SIP Trunk IP Group. This replace the host part of the SIP To header with destination IP address.	These rules are needed to ensure that the SIP OPTIONS requests are send to the correct IP address.
22	This rule is applied to OPTIONS messages sent to the Teams-Tenant-1 IP Group. This replace the user part of the SIP From header with the predefined value.	
23	This rule is applied to OPTIONS messages sent to the Teams-Tenant-1 IP Group. This replace the host part of the SIP Contact header with the SBC FQDN.	These rules required by Microsoft Teams Interface and needed to be configured per each Tenant (Customer).

23. Assign Manipulation Set ID 4 to the Swisscom SIP trunk IP Group:

- a. Open the IP Groups table (**Setup** menu > **Signaling & Media** tab > **Core Entities** folder > **IP Groups**).
- b. Select the row of the Swisscom SIP Trunk IP Group, and then click **Edit**.
- c. Set the 'Outbound Message Manipulation Set' field to **4**.

Figure 4-61: Assigning Manipulation Set 4 to the Swisscom SIP Trunk IP Group

The screenshot shows the 'IP Groups [SwisscomESIP]' configuration window. At the top, there is a dropdown for 'SRD' set to '#0 [DefaultSRD]'. The window is divided into several sections: 'GENERAL', 'QUALITY OF EXPERIENCE', 'MESSAGE MANIPULATION', and 'SBC REGISTRATION AND AUTHENTICATION'. In the 'GENERAL' section, the 'Outbound Message Manipulation Set' is currently set to '-1'. The 'MESSAGE MANIPULATION' section shows the 'Outbound Message Manipulation Set' has been changed to '4'. At the bottom, there are 'Cancel' and 'APPLY' buttons.

- d. Click **Apply**.

4.17 Configure SIP OPTIONS toward Teams

SIP OPTIONS is an important mechanism used to monitor the connectivity between the AudioCodes SBC to the Microsoft Phone System. Microsoft Phone System requires the FQDN of the trunk sent in the host part of the Contact header of SIP OPTIONS. The FQDN of the trunk is the name that was specified during the pairing that was performed in the customer's tenant, for example:

New-CSOnlinePSTNGateway -FQDN sbcX.Customers.ACeducation.info

By default, AudioCodes SBC send its own IP address in the Contact header of the SIP OPTIONS message:

Contact: <sip:96.66.240.133>;tag=1c153541232

However, it's mandatory by Microsoft, that the Contact header contains the FQDN of the SBC. Message Manipulation Rules used to configure sending the FQDN in the Contact header of SIP OPTIONS.

4.17.1 Configure FQDN in Contact Header of OPTIONS Message using Message Manipulations Set

This method allows manipulation of the Contact header based on the Destination address of the entity. For example,

- SIP OPTIONS going to sip.pstnhub.microsoft.com should be in the format:

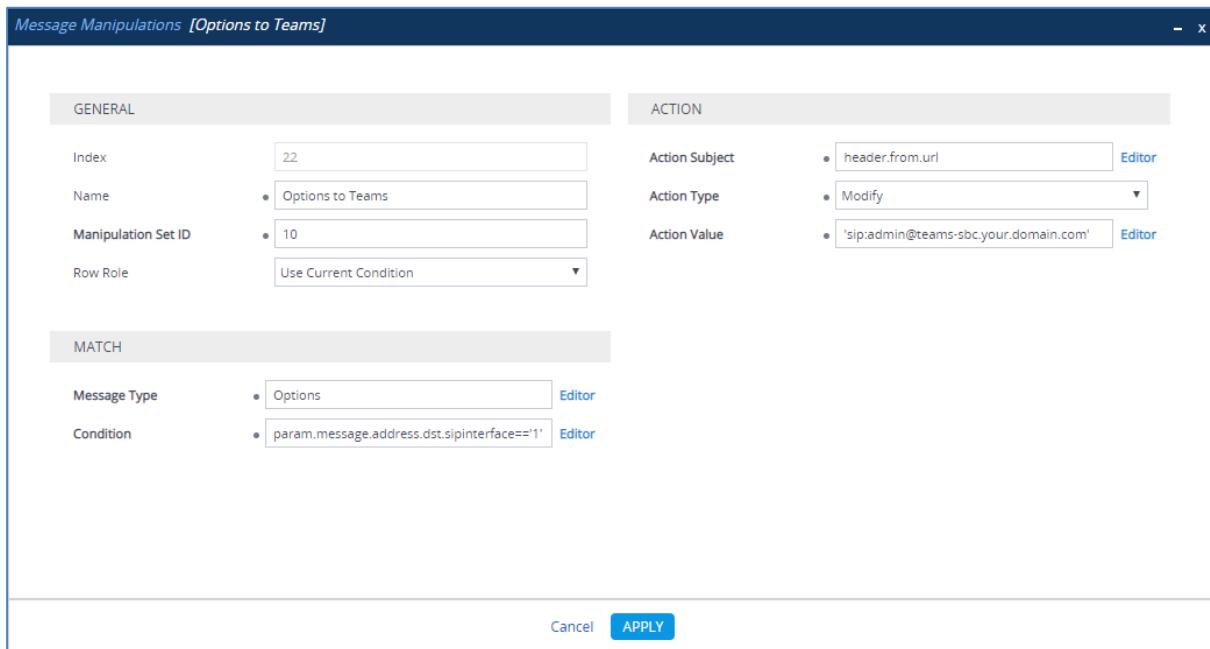

Contact:123456789@sbcX.Customers.ACeducation.info

The method will not function if you need to send a different FQDN in the Contact header to multiple entities.

➤ **To configure SIP message manipulation rule:**

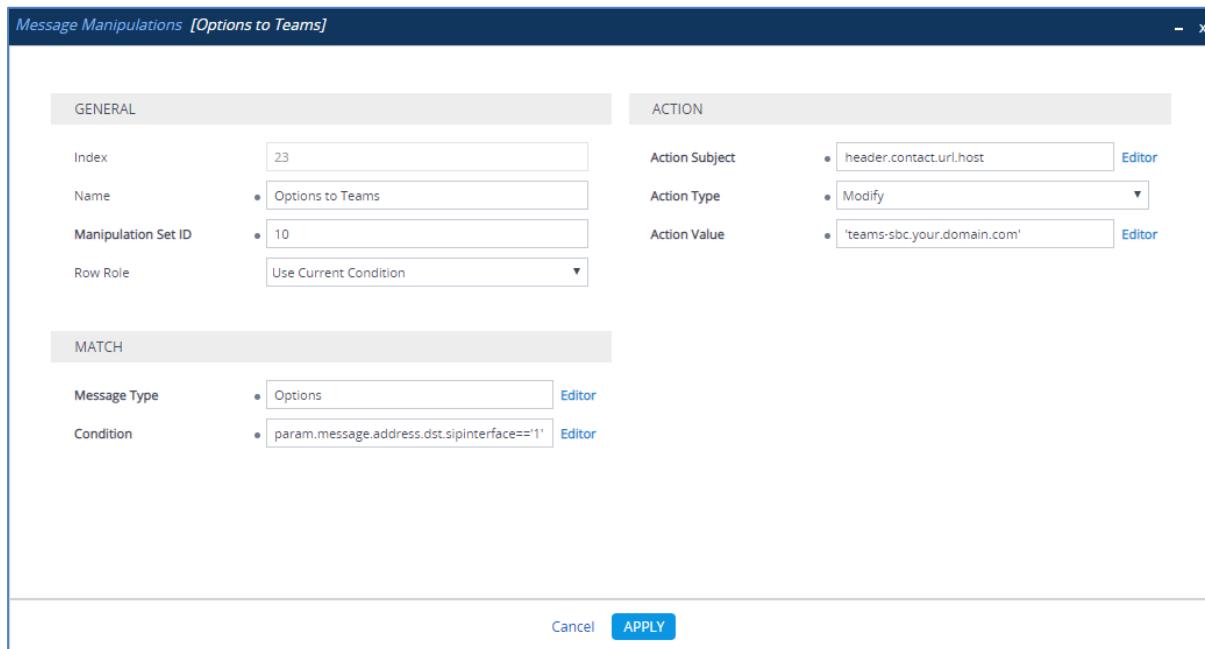

1. Open the Message Manipulations page (**Setup** menu > **Signaling & Media** tab > **Message Manipulation** folder > **Message Manipulations**).
2. Configure a new manipulation rule (Manipulation Set 10) for OPTIONS messages sent toward Microsoft Teams. This replaces the user part of the SIP From Header.

Parameter	Value
Index	22
Name	Options to Teams
Manipulation Set ID	10
Message Type	Options
Condition	param.message.address.dst.sipinterface=='1' (per SIP Interface Index value assigned to Teams)
Action Subject	header.from.url.user
Action Type	Modify
Action Value	'sip:admin@teams-sbc.your.domain.com' (per network configuration)

Figure 4-62: Configuring SIP Message Manipulation Rule 22 (for OPTIONS toward Teams)

- 3.** Configure another manipulation rule (Manipulation Set 10) for OPTIONS messages sent toward Microsoft Teams. This replaces the host part of the SIP Contact Header.

Parameter	Value
Index	23
Name	Options to Teams
Manipulation Set ID	10
Message Type	Options
Condition	param.message.address.dst.sipinterface=='1' (per SIP Interface Index value assigned to Teams)
Action Subject	header.contact.url.host
Action Type	Modify
Action Value	'teams-sbc.your.domain.com' (per network configuration)

Figure 4-63: Configuring SIP Message Manipulation Rule 23 (for OPTIONS toward Teams)

Note: If modification of the OPTIONS Request-URI header itself is required, for example, instead of sending **OPTIONS 99.66.240.132 SIP/2.0**, you need to send **OPTIONS sip:admin@teams-sbc.your.domain.com SIP/2.0**. You must also specify the Action Subject **header.request-uri.url**.

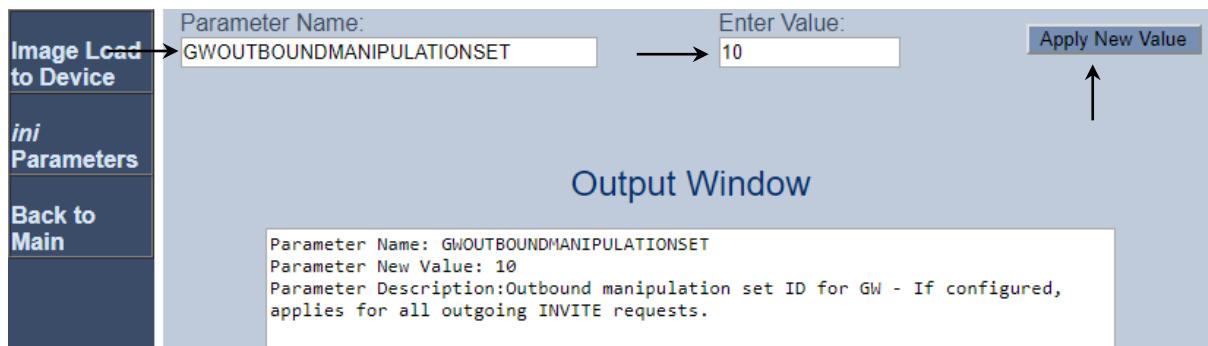

For a detailed description of the syntax used for configuring Message Manipulation rules, refer to the *SIP Message Manipulations Quick Reference Guide* on AudioCodes' website.

4.17.2 Assigning Message Manipulation Set as Gateway Outbound Manipulation Set

To apply changes to the SIP Options messages, Message Manipulation Set needs to be configured as Gateway Outbound Manipulation Set.

➤ **To configure the Gateway Outbound Manipulation Set:**

1. Open the Admin page.
2. Append the case-sensitive suffix 'AdminPage' to the device's IP address in your Web browser's URL field (e.g., `http://<SBC FQDN or IP>/AdminPage`).
3. In the left pane of the page that opens, click **ini Parameters**.

Figure 4-64: Configuring GW Outbound Manipulation Set via AdminPage

4. Enter these values in the 'Parameter Name' and 'Enter Value' fields:

Parameter	Value
GWOUTBOUNDMANIPULATIONSET	10 (Message Manipulation Set ID configured in the previous step)

5. Click the **Apply New Value** button.
6. Click on **Back to Main**. On the main page, don't forget to save the configuration.

4.18 Miscellaneous Configuration

This section describes miscellaneous SBC configuration.

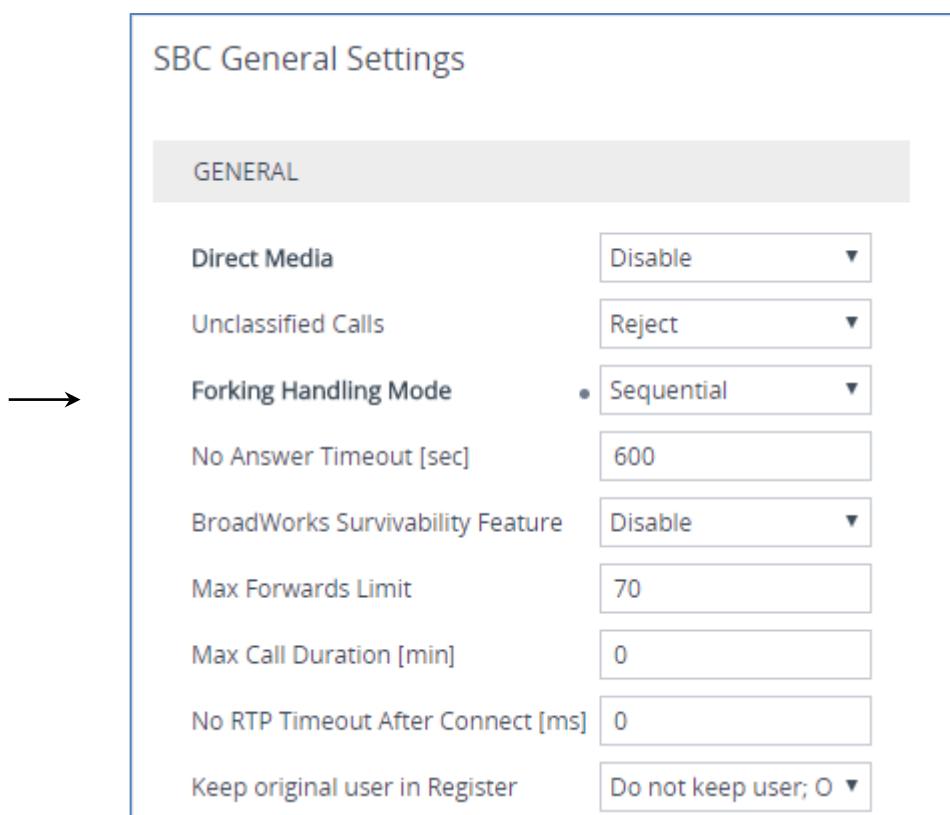

4.18.1 Configure Call Forking Mode

This step describes how to configure the SBC's handling of SIP 18x responses received for call forking of INVITE messages. For the interoperability test topology, if a SIP 18x response with SDP is received, the SBC opens a voice stream according to the received SDP. The SBC re-opens the stream according to subsequently received 18x responses with SDP or plays a ringback tone if a 180 response without SDP is received. It is mandatory to set this field for the Teams Direct Routing environment.

➤ **To configure call forking:**

1. Open the SBC General Settings page (**Setup** menu > **Signaling & Media** tab > **SBC** folder > **SBC General Settings**).
2. From the 'SBC Forking Handling Mode' drop-down list, select **Sequential**.

Figure 4-65: Configuring Forking Mode

3. Click **Apply**.

This page is intentionally left blank.

A AudioCodes INI File

The *ini* configuration file of the SBC, corresponding to the Web-based configuration as described in Section 4 on page 15, is shown below:

Note: To load or save an *ini* file, use the Configuration File page (**Setup** menu > **Administration** tab > **Maintenance** folder > **Configuration File**).

```
